DESCRIPTION

xPLAN V9.x Access Control Software for SOAA compatible lock-sets and cylinders.

Off-line Access Control administration and reporting software.

In addition to offering users a seamless blend of wired, wireless and wire-free access control the **xPLAN V9.x** desktop administration platform now supports the administration of access controlled doors fitted with **SOAA compatible** off-line escutcheon locksets and e-cylinders.

Using the advanced features of the xPLAN V9.x software and our growing range of optional complex updaters and validation readers, users can now benefit from a truly wire-free data on card access control solution using battery-powered locksets and e-cylinders.

With, or without the use of updaters, the PLAN System offers end users the option to control doors using a 'data-on-card' off-line approach - where the wireless concept is taken one stage further and the system becomes completely wire-free.

The software provides the user with an end to end admin and reporting facility. Password controlled access to the software allows a suitably authorised operator to simply and securely create new cards with access to doors individually or by groups.

Even without updaters, the enroller can be used to recover audit trail information from returned cards.

Lost cards are managed more or less automatically, by use of the viral black-list messaging structure which is carried to the locks by the user when they present the new card to the lock.

Complex updaters will also pre-emptively block a card from gaining access through the controlled door, as well as disabling the card for use at offline doors.
